300 Units for Injection

Prescription DYSPOTM is an injection used to temporarily improve the look of moderate to severe frown lines between the eyebrows (glabellar lines) in adults less than 65 years of age.

DYSPOTM is a purified formulation that has been shown to deliver temporary improvements in moderate to severe frown lines, even with repeat treatments.

Frown lines 101: What causes them?

Over time, repeated movement of the facial skin by the muscles forms frown lines between the eyebrows.

Wrinkles are not only age related. Frown lines are “dynamic”—they happen because of the way a person’s face moves. Because frown lines are created by facial movements such as frowning or squinting, they may develop even in younger adults. DYSPOTM is used to treat moderate to severe frown lines in adult patients less than 65 years of age.

The muscles above and between the eyebrows contract and tighten, and can cause wrinkles. DYSPOTM blocks the nerve signal that causes these facial muscles to contract. This ultimately results in a localized reduction of muscle activity in the treated area and temporarily stops the contraction of these muscles.

DYSPOTM dimensions

No downtime: With DYSPOTM, there is little to no downtime after injection. Ask your doctor about any precautions you should take after your treatment. Call your doctor or get medical help right away if you have any problems swallowing, speaking, or breathing. If this happens, do not drive a car, operate machinery, or do other dangerous activities.

Repeatable results: In clinical trials, the efficacy of DYSPOTM was demonstrated with up to 4 repeated treatments. You should wait at least 90 days between treatments. The safety of DYSPOTM has been studied in up to 12 repeated treatments.

Worldwide experience: DYSPOTM is used for aesthetic purposes in 36 countries. In U.S. clinical trials, DYSPOTM safety was studied in more than 2400 aesthetic patients. A total of 376 patients were studied for efficacy of the product.
